

Biological Drawings

Biological diagrams are accurate but simple drawings that show what the biologist actually sees, either with their eyes or using a microscope. Here are some guidelines for drawing them:

1. Use a sharp lead pencil.
2. Use unlined paper.
3. Draw clean, single lines to show outlines.
4. NEVER shade or colour in.
5. Add labels to each part using a ruled line.

Make a biological drawing of this **Antarctic sea pig** using the photo below.

Biologists would also add labels to show the different parts of the animal. Add a label to show the legs and, if you can discover where it is, the mouth. The mouth also acts as another part of the sea pig—can you find what it is?

Antarctic sea pig *Protelpidia murrayi* Photo credit: Stefano Schiaparelli/ IPY-CAML.
